

ABSTRACT OF THE DISCLOSURE

5 An automatic material handing system (AMHS). The
AMHS comprises a rail, an overhead shuttle (OHS) and a
stocker. The OHS moves on the rail. An in/out port (I/O
port) is disposed in the stocker. The rail passes
through the stocker and enters the I/O port. When the
OHS is in the I/O port, a transport device places goods
directly into the OHS.
